

Abstract of the Disclosure:

An assembly of a vibration-generating unit and a housing
accommodating the unit includes a vibration damper. The unit
is retained on the housing by way of at least one dampened
5 spring configuration that is linked with the unit on the one
hand and the housing on the other hand, each at a respective
connecting point. The spring configuration has at least one
single spring element that is capable of oscillating with a
resonant frequency different from that of the single spring
10 element.
